Additional equipment and reagents required

Phosphate buffered saline (PBS)
Microcentrifuge
RNAsa A (10 mg/ml)

Storage

PURO Genomic DNA can be stored dry at room temperature (15-25°C) for up to 12 months without showing any reduction in performance and quality. For longer storage, the kit can be stored at 2-8°C.
Introduction

PURO Genomic DNA is based on silica membrane technology and special buffer system for many kinds of sample’s gDNA extraction. The spin column made of new type silica membrane can bind DNA optimally on given salt and pH conditions. Simple centrifugation processing completely removes contaminants and enzyme inhibitors such as proteins and divalent cations. Purified DNA is eluted in low-salt buffer or water, ready for use in downstream applications.

DNA purified by PURO Genomic DNA is highly suited for restriction analysis, PCR analysis, Southern blotting, and cDNA library.

Yield of Genomic DNA with PURO Genomic DNA Kit

Important Notes

1. Repeated freezing and thawing of stored samples should be avoided, since this leads to reduced DNA size.
2. If a precipitate has formed in Buffer GA, warm buffer to 56°C until the precipitate has fully dissolved.
3. All centrifugation steps should be carried out in a conventional table-top microcentrifuge at room temperature (15-25°C).
Protocol

Ensure that Buffer GB has been prepared with appropriate volume of ethanol (96-100%) as indicated on the bottle and shake thoroughly.

1. Add 200 μl of whole blood to the microcentrifuge tube. If the sample volume is less than 200 μl, add the appropriate volume of PBS.
   For cultured cells, harvest the 5 x 10^6 cells and centrifuge for 5 min at 500 x g in a 1.5 ml microcentrifuge tube. Aspirate the medium and resuspend cell pellet in 200 ul of PBS.  
   Optional: RNase treatment of the sample. Add 4 μl of RNase A (10 mg/ml), mix by vortex, and incubate for 5 min at room temperature (15-25°C).

2. Add 20 μl Proteinase K (20 mg/ml), mix thoroughly by vortex.

3. Add 200 μl Buffer GA to the sample, mix thoroughly by vortex, and incubate at 56°C for 15 min to yield a homogeneous solution. Briefly centrifuge the 1.5 ml microcentrifuge tube to remove drops from the inside of the lid.

   **Note: Do not add Protease K directly to Buffer GA**

4. Add 200 μl ethanol (96-100%) to the sample, and mix thoroughly by vortex for 15 s. A white precipitate may form on addition of ethanol. Briefly centrifuge the 1.5 ml microcentrifuge tube to remove drops from the inside of the lid.

5. Pipet the mixture from step 4 into the Spin Column (in a 2 ml collection tube) and centrifuge at 12,000 rpm (~13,400 × g) for 30 s. Discard flow-through and place the spin column into the collection tube.
6. Add 500 µl Buffer GB (prepared with appropriate volume of ethanol 96-100%) to Spin Column, and centrifuge at 12,000 rpm (~13,400 x g) for 30 s, then discard the flow-through and place the spin column into the collection tube.

8. Centrifuge at 12,000 rpm (~13,400 x g) for 2 min to dry the membrane completely.

**Note:** The resident ethanol of buffer GB may have some affection in downstream application.

9. Place the Spin Column in a new clean 1.5 ml microcentrifuge tube, and pipet 50-200 µl Buffer GC or distilled water directly to the center of the membrane. Incubate at room temperature (15-25°C) for 2-5 min, and then centrifuge for 2 min at 12,000 rpm (~13,400 x g).

**Note:** If the volume of eluted buffer is less than 50 µl, or it may affect recovery efficiency. What’s more, the pH value of eluted buffer will have some influence in eluting, we suggest chose buffer GC or distilled water (pH 7.0-8.5) to elute gDNA. For long-term storage of DNA, eluting in Buffer GC and storing at –20°C is recommended, since DNA stored in water is subject to acid hydrolysis.
